Bank project: scenario and reading by role

The original supplied scenario, followed by separate preparation material for all five roles.

Prepared for 5DA06 · Reviewed 1 November 2026

Online reader: https://pqhhust.github.io/ai-ethics-atlas/

Original scenario · unchanged wording

*** LLM-as-a-service platform in banking services

A banking company is developing an internal LLM-as-a-service platform for all its employees. The company chooses LLMs, whether open-source or proprietary, and makes them available for use by its employees from all services. Employees can then build applications based on the chosen LLM for their own needs. This can lead to various applications like customer-facing chatbots, credit scoring algorithms for granting loans to individuals, and credit card or financial fraud detection. The bank thinks that some AI use cases in banking can lead to ethical and legal risks, it wonders how to ensure AI applications are built and deployed by its teams while ensuring trustworthiness and legal compliance. The bank also wonders what organization and processes it should put in place to ensure that employees using the LLM-as-a-service platform develop and deploy AI applications ethically. Reading paths for all five roles

Roles follow page 2 of video_case_studies_guidelines.pdf. Reading paths and preparation prompts below are study material, separate from the original scenario.

Computer scientist

Defend technical feasibility within the available time. Explain what the model should do in each bank application.

Model roles and technical safeguards

For the shared platform, identify the model supplier and the team building each downstream application. For credit and fraud, connect validation, logging, oversight and robustness to the actual decision.

AI Act · 3 · Definitions

Course: system boundaries and generative AI

Map the whole application: model, retrieval data, tools, employees, customer and review process. Compare an external API with self-hosting using the same operational requirements.

AI as a sociotechnical system · Intro-socio-of-AI-5DA06.pdf, pp. 9–20, 64–65 ·

Fraud-detection readings in the project brief

Read the methods and evaluation sections. Prepare a comparison with a non-LLM baseline and explain how you would test rare fraud events, changing behaviour and false alarms.

Ali et al. (2022): systematic literature review · https://doi.org/10.3390/app12199637

Awoyemi et al. (2017): comparative analysis · https://doi.org/10.1109/ICCNI.2017.8123782

Bring to the group discussion

- Draw the data flow for the chatbot, credit assessment and fraud detection separately.
- Propose a test plan with a baseline, held-out evaluation, error analysis, latency and cost.
- Explain how the application handles unsupported answers, model updates and rollback.

Jury practice

Why use an LLM for credit scoring or transaction fraud rather than a simpler model?

- I would compare the alternatives on the actual task before choosing the model.

- Language support and structured risk prediction can use different components.
- I would keep the simpler approach if an LLM does not justify its additional errors, cost and operational complexity.

Regulation / compliance officer

Classify each application under the AI Act and assess whether the proposed safeguards fit that use.

Classification, responsibilities and application dates

Read the creditworthiness category and its financial-fraud exception. Map provider/deployer responsibilities for employee-built applications and check the relevant commencement provisions.

Arnal (2025): Unfit for purpose? · https://cdn.ceps.eu/wp-content/uploads/2025/05/Unfit-for-purpose-ECRI-In-Depth-Analysis.pdf

Bring to the group discussion

- Bring a separate classification and duty map for each of the three applications.
- Explain the proposed credit release conditions and what meaningful human review requires in practice.
- Identify what changes if an employee repurposes an approved chatbot for credit assessment.

Jury practice

If the bank buys a compliant model, why does each employee-built application still need review?

- The model and the downstream application have different purposes and responsibilities.
- A customer chatbot can become part of a consequential decision when its use changes.
- I would require an application-level review and reassessment after material changes.

AI Ethics officer

Examine inequalities, power and the distribution of harms across customers, employees and other affected people.

Course: fairness, users and contestability

For lending, ask who loses access and why. For fraud, examine the burden of false alarms. For chatbots, ask whether customers can reach a person and challenge a harmful response.

Fairness, power and technosolutionism · Users-of-AI.pdf, pp. 5–16 · https://pqhhust.github.io/ai-ethics-atlas/#course/fairness

Users, expert fields and actual practice · Users-of-AI.pdf, pp. 17–25 · https://pqhhust.github.io/ai-ethics-atlas/#course/users

Explanations and contestability · Users-of-AI.pdf, pp. 26–35 · https://pqhhust.github.io/ai-ethics-atlas/#course/contestability

Ethics, safety and competing regulatory arenas · Intro-socio-of-AI-5DA06.pdf, pp. 34–58 · https://pqhhust.github.io/ai-ethics-atlas/#course/arenas

Course: labour and value chains

The platform affects employee discretion and work organisation. Include outsourced data work and the people who correct outputs, rather than treating automation as labour-free.

Platforms and the three forms of AI labour · EthicsAI_LaborAI_Abel.pdf, pp. 3–7, 18–34 · https://pqhhust.github.io/ai-ethics-atlas/#course/labour

French labour law · L2312-8 · CSE: consultation / workplace technology
https://code.travail.gouv.fr/code-du-travail/l2312-8

Bring to the group discussion

- Map affected groups and one concrete harm for each core application.
- Explain which fairness objective you prioritise, why, and what trade-off remains.
- Design a usable complaint and correction process with a named owner and review of recurring harms.

Jury practice

If average accuracy improves, why might you still oppose deployment?

- An average can hide concentrated harms, such as repeated false fraud alerts for a particular group.
- I would examine who bears those errors and whether they can obtain a timely correction.
- My recommendation would depend on the distribution of harm and the available remedy, as well as performance.

Cybersecurity expert

Defend confidentiality, integrity and availability across the shared platform and its downstream applications.

ICT governance, suppliers and contracts

For external model APIs, examine access, subcontracting, service continuity, incident cooperation and exit. Consider the bank's own operational responsibilities when self-hosting.

Course: the whole system and privacy

Employee access and application permissions are part of the system boundary. A secure model endpoint alone does not establish safe retrieval, logging or tool execution.

AI as a sociotechnical system · Intro-socio-of-AI-5DA06.pdf, pp. 9–20, 64–65 ·
https://pqhhust.github.io/ai-ethics-atlas/#course/sociotechnical

GDPR and automated decisions · Sept 25 - AI regulation.pdf, pp. 3–5; Users-of-AI.pdf, pp. 26–35; legal appendix ·
https://pqhhust.github.io/ai-ethics-atlas/#course/privacy

Generative AI, copyright and accountability · Sept 25 - AI regulation.pdf, pp. 3–9, 34–38; Intro-socio-of-AI-5DA06.pdf, pp. 29–33 ·
https://pqhhust.github.io/ai-ethics-atlas/#course/genai

Bring to the group discussion

- Draw trust boundaries and permissions for employees, applications, model providers and support staff.
- Prepare tests for cross-user data leakage, prompt injection and unauthorised tool actions.
- Describe outage handling, incident escalation, rollback and a tested supplier exit path.

Jury practice

Would hosting the model inside the bank solve the security problem?

- It changes who operates the infrastructure and which data flows leave the bank.
- The bank still needs access controls, patching, monitoring and tests of retrieval and tool permissions.
- I would compare both hosting options against a documented threat model and continuity plan.

Project manager

Challenge the other roles and turn their priorities into one coherent recommendation to the bank’s management.

Project and assessment instructions

Read the scenario, all five role cards and the video instructions. Prepare a negotiated recommendation, make every member speak, and keep the video within seven minutes.

Original banking scenario · https://pqhhust.github.io/ai-ethics-atlas/course/AI%20Ethics%20-%20Group%20Project.docx

Role cards · page 2 · https://pqhhust.github.io/ai-ethics-atlas/course/video_case_studies_guidelines.pdf#page=2

Video instructions · page 8 · https://pqhhust.github.io/ai-ethics-atlas/course/video_case_studies_guidelines.pdf#page=8

Course: stakeholders, value chains and reasoning

Make the trade-offs explicit: speed versus validation, cost versus resilience, and detection versus customer burden. Assign each release condition to an owner.

AI as a sociotechnical system · Intro-socio-of-AI-5DA06.pdf, pp. 9–20, 64–65 ·

Bring to the group discussion

- Present one decision for each core application, with a reason, owner, required evidence and stop condition.
- Show a disagreement, the compromise reached and its remaining cost or risk.
- Prepare the seven-minute run sheet and arrange the coaching session requested in the course instructions.

Jury practice

The safeguards delay the rollout. What would you recommend to the board?

- I would separate the applications and prioritise a bounded use with a clear benefit and manageable risks.
- I would budget and assign the work needed for the more consequential uses rather than promise an unconditional launch date.
- If the expected benefit no longer justifies that work, I would recommend changing or stopping that use.
